Fecal Rotavirus Antigen ELISA Assay Kit

Catalog Number:
RTV35-K01 (1 x 96 wells)
For Research Use Only. Not for use in diagnostic procedures.
v.1.0
**INTENDED USE**
Eagle Biosciences Fecal Rotavirus Antigen ELISA (enzyme linked immunosorbent assay) kit is intended for the qualitative and quantitative detection of rotavirus antigen in feces. Specifically, this test detects VP6 of the viral capsid and is useful in detection of type A rotavirus infection. The assay is a useful tool in the diagnosis of active rotavirus infection in acute or chronic gastroenteritis. The Eagle Biosciences Fecal Rotavirus Antigen ELISA Assay kit is intended for research use only and not intended for diagnostic procedures.

**ASSAY BACKGROUND**
Rotaviruses are the main and the most important pathogens that cause of non-bacterial acute gastroenteritis and diarrhea, especially in children from 6 months to 2 years of age, premature infants, the elderly, and the immunocompromised individuals. Rotaviruses have been identified in almost 40% of the faces of children with gastroenteritis. Rotavirus is the cause of up to 50% of the hospitalized cases of diarrhea in infant and young children. Almost every child has been infected with rotavirus by age 5. Over 3 million cases of rotavirus gastroenteritis occur annually in the US. There are about 120 million rotavirus infections every year worldwide and that causes the death of 600,000 to 650,000 children. Study also indicates that a high frequency of rotavirus infections may increase the risk of celiac disease autoimmunity in childhood in genetically predisposed individuals.

Rotaviruses have a genome consisting of 11 double-stranded RNA segments surrounded by a distinctive three-layered icosahedral protein capsid. The first layer is formed by the protein VP2, with each vertex having a copy of the proteins VP1 and VP3. The second layer is formed by the protein VP6. The outermost protein layer is composed of the structural glycoprotein VP7 and the spike protein VP4. Viral particles are up to 100 nm in diameter and have a buoyant density of 1.36 g/ml in CsCl. Rotaviruses tend to affect gastrointestinal epithelial cells that are at the tip of the villus. Their triple protein coats make them very resistant to the normally prohibitive pH of the stomach, and also digestive enzymes (lipases and proteases) in the gastrointestinal tract. During the infection, rotavirus produces mRNA to support both protein translation and genome replication.

Rotavirus is transmitted by oral-fecal contact with an incubation period of 1-3 days. Characteristic symptoms include vomiting, hydrodiarrhoea for between 3 and 8 days, high temperature and stomach pains. A large amount of rotavirus particles is shed during infection.

Specific diagnosis of the rotavirus infection is made by identification of the virus in the patient's stool. Enzyme linked immunsorbent assay (ELISA) is the test most widely used to screen clinical specimens. Electron microscopy and polyacrylamide gel electrophoresis are used in some laboratories in addition or as an alternative to ELISA.

**PRINCIPLE OF THE ASSAY**
This Eagle Biosciences Fecal Rotavirus Antigen ELISA is designed, developed and produced for the qualitative and quantitative measurement of rotavirus antigen in test specimen. The assay utilizes the microplate-based enzyme immunoassay technique by coating highly purified antibody onto the wall of microwell. Assay controls and fecal specimen, as well as HRP-conjugated monoclonal antibody that specifically recognize the inner capsid protein of the rotaviruses are added to microtiter wells of microplate that was coated with a highly purified polyclonal anti-rotavirus antibody on its wall. After an incubation period an immunocomplex of “Anti-Rotavirus Antibody – Rotavirus Antigen –
HRP-conjugated Anti-rotavirus Tracer Antibody” was formed if there is rotavirus antigen present in the test sample. The unbound tracer antibody and other protein or buffer matrix are removed in the subsequent washing step. HRP-conjugated tracer antibody bound to the well is then incubated with a substrate solution in a timed reaction and then measured in a spectrophotometric microplate reader. The enzymatic activity of the tracer antibody bound to rotavirus captured on the wall of each microtiter well is directly proportional to the amount of rotavirus antigen level in each test specimen.

REAGENTS: Preparation and Storage
This Eagle Biosciences Fecal Rotavirus Antigen ELISA Assay kit must be stored at 2 – 8°C upon receipt. For the expiration date of the kit refer to the label on the kit box. All components are stable until this expiration date.

Prior to use allow all reagents to come to room temperature. Reagents from different kit lot numbers should not be combined or interchanged.

1. Anti-Rotavirus Antibody Coated Microplate
One microplate with 12 x eight strips (96 wells total) coated with highly purified anti-rotavirus antibody. The plate is framed and sealed in a foil Ziploc bag with a desiccant. This reagent should be stored at 2 – 8°C and is stable until the expiration date on the Eagle Biosciences Fecal Rotavirus Antigen ELISA Assay Kit.

2. Anti-Rotavirus Tracer Antibody
One vial containing 12 mL concentrated horseradish peroxidase (HRP)-conjugated monoclonal anti-rotavirus tracer antibody in a stabilized protein matrix. This reagent should be stored at 2 – 8°C and is stable until the expiration date on the kit box.

3. ELISA Wash Concentrate
One bottle contains 30 mL of 30-fold concentrate. Before use the contents must be diluted with 870 mL of demineralized water and mixed well. Upon dilution this yields a working wash solution containing a surfactant in phosphate-buffered saline with a non-azide preservative. The diluted wash buffer should be stored at room temperature and is stable until the expiration date on the kit box.

4. ELISA HRP Substrate
One bottle contains 12 mL of tetrathylbenzidine (TMB) with hydrogen peroxide. This reagent should be stored at 2 – 8°C and is stable until the expiration date on the kit box.

5. ELISA Stop Solution
One bottle contains 12 mL of 0.5 M sulfuric acid. This reagent should be stored at 2 – 8°C or room temperature and is stable until the expiration date on the kit box.

6. Rotavirus Antigen Calibrator 6
1 vial containing 1.5 mL of Rotavirus Antigen Calibrator 6. This calibrator is in a liquid bovine serum albumin-based matrix with a non-azide preservative. Refer to vials for exact concentration. This reagent should be stored at -20°C and is stable until the expiration date on the kit box.

7. Concentrated Patient Sample Diluent
One bottle contains 30 mL of 10-fold concentrated buffer matrix with protein stabilizers and preservative. This reagent should be stored at 2 – 8°C and is stable until the expiration date on the kit box. Before use the concentrated buffer must be diluted with 290 mL of distilled water and mixed well. Upon dilution this yields a working calibrator 6 matrix buffer, negative control, and patient sample diluent containing a surfactant in phosphate-buffered saline with a non-azide preservative. The diluted sample diluent can be stored at room temperature and is stable for 8 weeks. It can also be stored at 2 – 8°C and is stable until the expiration date on the kit box.

SAFETY PRECAUTIONS
The reagents must be used in a laboratory and are for professional use only. Source material for reagents containing bovine serum albumin was derived in the contiguous 48 United States. It was obtained only from healthy donor animals maintained under veterinary supervision and found free of contagious diseases. Wear gloves while performing this assay and handle these reagents as if they are potentially infectious. Avoid contact with reagents containing TMB, hydrogen peroxide, or sulfuric acid. TMB may cause irritation to skin and mucous membranes and cause an allergic skin reaction. TMB is a suspected carcinogen. Sulfuric acid may cause severe irritation on contact with skin. Do not get in eyes, on skin, or on clothing. Do not ingest or inhale fumes. On contact, flush with copious amounts of water for at least 15 minutes. Use Good Laboratory Practices.

MATERIALS REQUIRED BUT NOT PROVIDED
- Precision single channel pipettes capable of delivering 10 µL, 50 µL, 100 µL, and 1000 µL, etc.
- 25 - 50 µL inoculating loop.
- Repeating dispenser suitable for delivering 100 µL.
- Disposable pipette tips suitable for above volume dispensing.
- Disposable 12 x 75 mm or 13 x 100 glass or plastic tubes.
- Disposable plastic 1000 mL bottle with caps.
- Aluminum foil.
- Deionized or distilled water.
- Plastic microtiter well cover or polyethylene film.
- ELISA multichannel wash bottle or automatic (semi-automatic) washing system.
- Spectrophotometric microplate reader capable of reading absorbance at 450 nm.

SPECIMEN COLLECTION & STORAGE
1. Stool specimens can be collected at any time of the day.
2. Collect a random sample of feces into a fecal sample collection container or tube or cup with an aid of a clean, dry cup or plastic spoon or toilet paper.
3. It is required to collect minimum 0.1 mL liquid stool sample or 0.1 g solid sample.
4. The specimen is ready for testing, transportation or storage. It can be stored at 2-8°C for up to 3 days and at frozen condition (-20°C) for longer storage.

ASSAY PROCEDURE
(1) Prior to use allow all reagents to come to room temperature. Reagents from different kit lot numbers should not be combined or interchanged.
(2) ELISA Wash Concentrate must be diluted to working solution prior use. Please see REAGENTS section for details.
(3) Concentrated Patient Sample Diluent must be diluted to working solution prior use. Please see REAGENTS section for details.

(4) Prepare 1:3 serially diluted calibrators using Rotavirus Ag Calibrator Level 6 and 1x Patient Sample Diluent as the dilution buffer. Store at 2-8°C, -20°C for long term storage, Avoid more than 3x freeze thaw cycle.

2. Patient Sample Preparation

2.1. For manual weighing procedure only:

Patient samples need to be diluted 1:11 with 1x Patient Sample Diluent before being measured.

(1) Label a test tube (12x75 mm) or a 4 ml plastic vial.
(2) With solid stool sample, take or weigh an equivalent amount (about 90mg, size of a green pea) with a spatula or a disposable inoculation loop. Suspend the solid stool sample with 1 mL 1x Patient Sample Diluent and mix well on a vortex mixer.
(3) Centrifuge the diluted fecal sample at 3000 rpm (800-1500 g) for 5-10 minutes. The supernatant can be directly used in the assay. As an alternative to centrifuging, let the diluted samples sit and sediment for 30 minutes and take the clear supernatant for testing.

Note: If the test procedure is performed on an automated ELISA system, the supernatant must be particle-free by centrifuging the sample.

(4) This sample can be stored at 2-8°C up to three (3) days and below -20°C for longer storage. Avoid more than 3x freeze and thaw cycle.

2.2. Using Fecal Sample Collection Devices

(1) Label a Fecal Sample Collection tube
(2) Follow the instructions on the Sample Collection Tube insert.
(3) This sample can be stored at 2-8°C up to three (3) days and below -20°C for longer storage. Avoid more than 3x freeze and thaw cycle.
(4) Two drops of the extracted sample is equivalent to 100 µl.

3. Assay Procedure

(1) Place a sufficient number of anti-rotavirus antibody-coated microwell strips in a holder to run rotavirus controls and unknown samples in duplicate.
(2) Test Configuration
(3) Add 100 µL of working calibrators (or controls) and diluted patient stool samples into each designated microwell. **Note:** if the collection tubes are used, add two drops of extracted fecal sample into each well.

(4) Incubate plate at room temperature for 1 hour.

(5) Remove the plate sealer. Aspirate the contents of each well. Wash each well 5 times by dispensing 350 µL to 400 µL of working wash solution into each well and then completely aspirating the contents. Alternatively, an automated microplate washer can be used.

(6) Add 100 µL of above tracer antibody solution to each of the wells.

(7) Cover the plate with one plate sealer and also with aluminum foil to avoid exposure to light.

(8) Incubate plate at room temperature for 30 min.

(9) Remove the plate sealer. Aspirate the contents of each well. Wash each well 5 times by dispensing 350 µL to 400 µL of working wash solution into each well and then completely aspirating the contents. Alternatively, an automated microplate washer can be used.

(10) Add 100 µL of ELISA HRP Substrate into each of the wells.

(11) Cover the plate with aluminum foil to avoid exposure to light.

(12) Incubate plate at room temperature for 20 minutes.

(13) Remove the aluminum foil. Add 100 µL of ELISA Stop Solution into each of the wells. Mix gently.

(14) Read the absorbance at 450 nm within 10 minutes in a microplate reader.

**PROCEDURAL NOTES**

1. It is recommended that all controls and unknown samples be assayed in duplicate. The average absorbance reading of each duplicate should be used for data reduction and the calculation of results.

2. Keep light-sensitive reagents in the original amber bottles.

3. Store any unused antibody-coated strips in the foil Ziploc bag with desiccant to protect from moisture.
4. Careful technique and use of properly calibrated pipetting devices are necessary to ensure reproducibility of the test.
5. Incubation times or temperatures other than those stated in this insert may affect the results.
6. Avoid air bubbles in the microwell as this could result in lower binding efficiency and higher CV% of duplicate reading.
7. All reagents should be mixed gently and thoroughly prior to use. Avoid foaming.

**INTERPRETATION OF RESULTS**

**Quantitative Measurement**
1. Calculate the average absorbance for each pair of duplicate test results.
2. Subtract the average absorbance of the calibrator 1 (0 U/mL) from the average absorbance of all other readings to obtain corrected absorbance.
3. The calibrator curve is generated by the corrected absorbance of all calibrator levels on the ordinate against the calibrator concentration on the abscissa using point-to-point or log-log paper. Appropriate computer assisted data reduction programs may also be used for the calculation of results.

The Rotavirus concentrations for the unknown samples are read directly from the calibrator curve using their respective corrected absorbance.

**Qualitative Measurement**
1. Positive or reactive: Any sample well that is obviously more yellow than the negative control well.
2. Negative or non-reactive: Any sample well that is not obviously more yellow than the negative control well.

Note: The negative control, as well as some patient samples, may show some slight yellow color. A sample well must be obviously darker or more yellow than the negative control well, when it is interpreted as a positive result.

**ELISA Reader:**
1. Calculate the average absorbance for each pair of duplicate test results.
2. Calculate the cut-off
   The positive cut-off and the negative cut-off are established by using following formula.
   
   Positive Cut-Off = 1.1 x (mean extinction of negative control + 0.08)
   Negative Cut-Off = 0.9 x (mean extinction of negative control + 0.06)

3. Interpret test result
   - Positive: patient sample extinction is greater than the Positive Cut-Off
   - Negative: patient sample extinction is less than the Negative Cut-Off
   - Equivocal: patient sample extinction is between the Positive Cut-Off and the Negative Cut-Off.

4. Assay quality control
   1. Positive control must show an average OD reading greater than 0.8.
   2. Negative control should show an average OD reading less than 0.1.

EXPECTED RESULTS
Normal healthy individuals should be free of rotavirus antigen in feces and should show a negative test result. A positive test result indicates that the patient is shedding detectable amounts of rotavirus antigen. Incidence of rotavirus infection varies significantly in populations, season of the year and geographic regions.

Quantitative Measurement:
Stool from 40 normal adults were measured with this ELISA. We found that normal people show undetectable Rotavirus antigen in the extracted stool sample according to the sample collection, extraction and assay procedures described in this insert. The suggested positive cut-off for fecal Rotavirus antigen is 3 U/mL.

LIMITATION OF THE PROCEDURE
1. The results obtained with this fecal rotavirus antigen test kit serve only as an aid to diagnosis and should not be interpreted as diagnostic in themselves. Rotavirus antigen negative results in untreated patients does not rule out the infection.
2. Since there is no Gold Standard concentration or controls available for rotavirus antigen measurement, the values of assay controls were established and calibrated by the kit manufacturer.
3. Large particle of feces in a test sample and being added to microtiter plate would cause unexpected false test results.
4. Water deionized with polyester resins may inactive the horseradish peroxidase enzyme.

QUALITY CONTROL
To assure the validity of the test run, the OD value of the negative control must be below 0.1 and the OD of the positive control must be greater than 0.8. Moreover, each assay should include adequate controls with known rotavirus antigen level. We recommend that all assays include the laboratory’s own controls in addition to those provided with this Fecal Rotavirus Antigen ELISA Assay Kit.

Warranty Information

Eagle Biosciences, Inc. warrants its Product(s) to operate or perform substantially in conformance with its specifications, as set forth in the accompanying package insert. This warranty is expressly limited to the refund of the price of any defective Product or the replacement of any defective Product with new Product. This warranty applies only when the Buyer gives written notice to the Eagle Biosciences within the expiration period of the Product(s) by the Buyer. In addition, Eagle Biosciences has no obligation to replace Product(s) as result of a) Buyer negligence, fault, or misuse, b) improper use, c) improper storage and handling, d) intentional damage, or e) event of force majeure, acts of God, or accident.

Eagle Biosciences makes no warranties, either expressed or implied, except as provided herein, including without limitation thereof, warranties as to marketability, merchantability, fitness for a particular purpose or use, or non-infringement of any intellectual property rights. In no event shall the company be liable for any indirect, incidental, or consequential damages of any nature, or losses or expenses resulting from any defective product or the use of any product. Product(s) may not be resold, modified, or altered for resale without prior written approval from Eagle Biosciences, Inc.

For further information about this kit, its application or the procedures in this kit, please contact the Technical Service Team at Eagle Biosciences, Inc. at info@eaglebio.com or at 866-411-8023.
